Abstract

Scabies or scabies is a skin disease caused by the huminx variant of the *Saecoptes scabei* mite. The purpose of this study was to determine the potential for personal hygiene, behavior, basic sanitation as scabies at the al-iman Islamic boarding school, Bangunrejo village, Sukorejo sub-district, Ponorogo district in 2022.

This type of research is descriptive, with survey methods and observation sheets and questionnaires. For sampling using proportional random sampling with a total sample of 250 respondents and then a sample of 152 was taken.

The results of the research on bad personal hygiene were 95 (62.5%), good behavior 93 (61.1%), basic sanitation overall value 92 (61.3%). Personal hygiene is related to scabies, behavior and basic sanitation are not related to scabies. The conclusion from this study is that the potential cause of scabies at the Al-Iman Putra Islamic boarding school is related to personal hygiene and behavior and sanitation, not a cause related to scabies. Suggestions in this study for the cottage to always maintain personal and environmental hygiene so as not to get scabies.

Keywords: Personal Hygiene, Behavior, Basic Sanitation
