**Background :** Hypertension has an impact on physical, psychological, social and environmental aspects which in turn has an impact on the quality of life of a person with hypertension. This is because hypertension can have a negative impact on social functioning, mental health, psychological functioning and vitality. Hypertension and quality of life have a reciprocal relationship, hypertension can affect quality of life and vice versa quality of life can affect hypertension.

**Methods :** This research is a quantitative descriptive analytic research. With a cross sectional approach, the population is hypertension patients at the Mulyorejo Health Center. A sample of 112 hypertensive patients based on purposive sampling technique. Data collection using the WHOQOL-BREF quality of life questionnaire. Meanwhile, data analysis used a descriptive univariate test in the form of a frequency distribution.

**Result :** The results of the study in the physical health domain showed that 70 respondents had a moderate quality of life (62.5%), 39 respondents (34.82%) had a good quality of life, 3 respondents (2.7%) had a poor quality of life. In the psychological domain, there were 83 respondents with a moderate quality of life (74.11%), 26 respondents (23.21%) for a good quality of life, and 3 respondents (2.7%) for bad. In the social relations domain, including the moderate category, 92 respondents (82.14%) were in the good category, 15 respondents were bad, while in the environmental domain, there were 103 respondents who were in the moderate category (92%) and 9 respondents (8%) were in the bad category.

**Conclusion :** The majority of hypertensive patients at the Mulyorejo Health Center in Surabaya City have a moderate quality of life, namely 107 people (95.5%), and a good quality of life, as many as 5 people (4.5%)
